

## Features

- 12 RJ45 ports
- Types of wiring schemes (T568A or T568B) that can be used.
- 110 terminations for efficient connectivity
- RoHS compliance and UL listing for safety and environmental regulations
- Cable organization and management
- Simplifying troubleshooting process
- Documentation and traceability benefits
- Prevention of tangled cables

The CN KD-KJ5-01 Cat5e patch panel is an essential component in any local area network (LAN) setup. This mounted hardware assembly contains 12 ports, allowing for the efficient management and organization of Ethernet cables. With this patch panel, you can easily connect and manage multiple devices, such as computers, printers, and routers, in a single network.

One of the main benefits of using a patch panel is its ability to simplify troubleshooting. In case of any network connectivity issues, you can easily identify and replace a faulty cable by simply tracing it to the specific port on the patch panel. This eliminates the need to trace individual cables, saving time and effort.

In addition to simplifying troubleshooting, the CN KD-KJ5-01 Cat5e patch panel also provides documentation and traceability. With each port numbered and labeled, you can easily identify which device is connected to a particular port. This makes it easier to keep track of your network connections, especially in large setups with multiple devices.
